Heating Cooling Curve For Water

Heating Curves. Figure 11.7. 3 shows a heating curve, a plot of temperature versus heating time, for a 75 g sample of water. The sample is initially ice at 1 atm and -23°C ; as heat is added, the temperature of the ice increases linearly with time. The slope of the line depends on both the mass of the ice and the specific heat (C_s) of ice, which is the number of joules required to raise the temperature of 1 g of ice by 1°C .

In this video I will explain the concept of heating and cooling curves as they applies to water and ethanol.

Heating Curves and Cooling Curves - YouTube

The water could then be cooled to (0^{o}C) , at which point continued cooling would freeze the water to ice. The ice could then be cooled to some point below (0^{o}C) . This could be diagrammed in a cooling curve that would be the reverse of the heating curve.

For water, this temperature is 100°C because the boiling point for water is 100°C . Different substances have different melting points and boiling points, but the shapes of their heating curves are very similar. For example, this is the heating curve for iron, a metal that melts at 1538°C and boils at 2861°C .
